Information increase in contexts

$$\frac{}{\cdot \sqsubseteq \cdot}$$

$$\frac{\Gamma_1 \sqsubseteq \Gamma_2 \quad A \sqsubseteq B}{\Gamma_1, x : A \sqsubseteq \Gamma_2, x : B}$$

Metatheory

If $\Gamma \vdash e \Leftarrow A \Rightarrow B \dashv \Gamma'$, then:

- $A \sqsubseteq B$ (proof: induction)
- $\Gamma \sqsubseteq \Gamma'$ (proof: induction)

Output contexts – abridged basic rules

$$\frac{}{\Gamma_1, x : A, \Gamma_2 \vdash x \Leftarrow B \Rightarrow A \sqcup B \dashv \Gamma_1, x : A \sqcup B, \Gamma_2}\textsc{Var}$$

$$\frac{\Gamma \vdash a \Leftarrow A \Rightarrow A' \dashv \Gamma' \quad \Gamma' \vdash b \Leftarrow B \Rightarrow B' \dashv \Gamma''}{\Gamma \vdash (a, b) \Leftarrow A \times B \Rightarrow A' \times B' \dashv \Gamma''}$$

$$\frac{e \Leftarrow A \times \mathbf{?} \Rightarrow A' \times B}{\texttt{outl}\ e \Leftarrow A \Rightarrow A'} \qquad \frac{e \Leftarrow \mathbf{?} \times B \Rightarrow A \times B'}{\texttt{outr}\ e \Leftarrow B \Rightarrow B'}$$

Types, holes, terms and contexts

Holes:

$H ::= \alpha \mid H_1 \to H_2 \mid H_1 \times H_2 \mid H_1 + H_2 \mid \mathbf{1} \mid \mathbf{0}$

Terms:

$$
\begin{aligned}
e ::= {} & \\
& x \mid (e : H) \mid \\
& \lambda x.\, e \mid e_1\ e_2 \mid \\
& (e_1, e_2) \mid \texttt{outl}\ e \mid \texttt{outr}\ e \mid \\
& \texttt{inl}\ e \mid \texttt{inr}\ e \mid \texttt{case}\ e\ \texttt{of}\ (e_1, e_2) \mid \\
& \texttt{unit} \mid \texttt{exfalso}\ e
\end{aligned}
$$

Note: the terms are the same as in STLC with Hints.

Contexts and judgements

Contexts:
$\Gamma ::= \cdot \mid \Gamma, x : A \mid \Gamma, \alpha \mid \Gamma, \alpha := H$

We introduce unification variables, denoted with Greek letter $(\alpha, \beta, \gamma, \dots)$. When extending the context with a unification variable, it is set to some hint, which at the beginning will be just **?**.

Judgements:
$\Gamma \vdash e \Leftarrow H \Rightarrow H' \dashv \Gamma'$ – in context Γ, term e checks with hint H and infers hint H' in output context Γ'
